

GUIDE - KavachX NPU

Onboarding guide for the edge device. Follow it top to bottom the first time; after that use it as a reference.

Read `README.md` alongside this - this file is *how to operate the box*, the README is *what the technical problem is*. You need both.

Step 1 - Connect

1: Install the cloudflared Binary

Download cloudflared in your respective os : <https://developers.cloudflare.com/tunnel/downloads/>

2: Configure a Dynamic SSH Block

Open your user profile SSH routing configuration file:

```
mkdir -p ~/.ssh  
  
nano ~/.ssh/config
```

Append this block exactly. By intentionally omitting a hardcoded username, OpenSSH dynamically delegates variables depending on your prompt parameters

```
Host ssh.kavachx.io  
  ProxyCommand cloudflared access ssh --hostname %h  
  ServerAliveInterval 30  
  ServerAliveCountMax 10
```

Save and close the file (Ctrl+O, Enter, Ctrl+X)

Establish Connection via

```
ssh work_user2@ssh.kavachx.io
```

Device hostname is `Kavach-EdgeBox`.

Your account is set up for SSH key login only - you should have sent your public key (`~/.ssh/id_cd25519.pub`) ahead of time. There is no password

fallback for this account; if the connection is rejected, check that the key you're connecting with matches the one you sent or the directories of cloudflare tunnel are right.

| Sanity check that you landed in the right account:

```
whoami      # -> work_user2 (or whatever your assigned username was)
pwd          # -> /home/work_user2
id           # -> should list 'render' (that's your NPU access)
ls kawachx_task # -> models/ npu_worker/ test_images/ NPU_DEPLOYMENT_TASK.md
```

If `render` is missing from `id`, stop. Nothing NPU-related will work.

Ask for it to be added, then log out and back in - group changes only apply to new sessions
